DESCRIBE THE PRESENT AND ORIGINAL (if known) PHYSICAL APPEARANCE

Order of Significance: First

Recommended Treatment: Preservation

Description:

Present. A narrow, single-file, twisting, and occasionally slightly abraded trail over fields of cooled, hard, tough lavas; some fields being rough and scoriaceous and others smooth and billowy; above 11,600-foot elevation; leading up the broad southeast flank of Mauna Loa volcano to and along the east side of Mokuaweoweo, the major summit crater. The trail along the crater's edge is above the 13,200-foot elevation. Intermittent, and in places infrequent, stacks of loose lava boulders (each stack called an ahu in the Hawaiian language) line its sides to mark the trail. Abraded spots occur only on the rare surface types subject to pockmarking by metal blows, and this has been done by iron-shod hoofs since the 1870's, when mounts began to be used.

Original. Same as above, except without the abraded spots. Bare feet and feet protected by leaf sandals or leather boots, leave no marks on the lava surfaces. Some rock stacks may have been added and others destroyed since 1870, and some cracks filled in 1913 to permit easier horse and mule passage.

Length of trail above 11,600 feet to near "Jaggar's Cave, "approximately 11 miles.

Actual boundaries are 200 feet on each side of the trail, which in places may be wide. The trail, in places, consists of numerous twisting alternate routes leading across a broad sloping area of billows and hollows of comparatively smooth-surfaced pahoehoe lavas. Other parts may be a stretch of narrow path through clinker-like aa lava, jumbled massive lava blocks, or winding between irregular and odd-shaped hillocks. Areas of multiple-choice routes are usually marked by rock stacks to indicate the general direction, but such stacks may be widely spaced and visible only on the horizon, if weather permits. The stacks are usually placed so as to be visible against the skyline to travelers going upslope. Some of the trail is obvious and forms the only practical foot route ahead in the desired direction. Rock-stack markers are less frequent in obvious trail areas.

The portion of the Ainapo trail covered by this nomination is the upper (and still visible) portion of the principal Hawaiian route to the summit of Mauna Loa. That portion of the trail below 11,600-foot elevation is not included in this nomination; much of it is not visible in 1973, having been disturbed through ranching operations and vegetative

7. DESCRIPTION

changes in recent historic times. A portion of the trail included in this nomination lies outside the boundaries of Hawaii Volcanoes National Park; this portion being the stretch between the 11,600-foot elevation and the boundary of the National Park at approximately the 12,560-foot elevation.

Date of construction. Prehistoric. Improved for horses in 1913.

Cost Estimate (for level of treatment): \$1,000 initially; then \$100 annually to maintain..

Brief Description of Work: Rebuild rock cairns which mark trail for approximately 7 miles, starting at Wilkes campsite at 13,240 feet above sea level and going down upper slopes of Mauna Loa, until trail disappears at about 11,600-foot elevation. Note: Extremely remote, barren, and waterless location above 11,600-foot elevation. Transportation and support by helicopter.

From prehistoric times through 1916, the Ainapo trail was the customary route to the summit crater of Mauna Loa volcano. The trail was 34-miles long (almost 55 km); rose from 2,000 feet to 13,200 feet above sea level; and supplied shelter, water, and firewood to Hawaiians. Foreigners also used it afoot after 1794, and after 1870 rode horses and mules over it. Only the portion above the 11,650-foot elevation remains intact.

Prehistoric Hawaiians laid out the Ainapo foot trail to assure availability of shelter, drinking water, and firewood between their nearest permanent settlement, Kapapala village, and Mokuaweoweo, the summit crater. Kapapala village could be reached over easy-grade trails from the coastal Hawaiian settlements. Most Mauna Loa ascents by Hawaiians were made during summit eruptions, when the volcano goddess Pele was present, to honor her with chanted prayers and offerings; and perhaps at other times to honor a site she frequented.

From the records left by early foreigners, the Hawaiian Ainapo trail practices have been reconstructed. The Hawaiian style of ascent to Mokuaweoweo lay in moving upslope in easy stages to lessen fatigue and permit acclimatization to the increasingly rarefied atmosphere. The major stages were a series of overnight camps, each complete with small, warm, thatched houses and well supplied with food, drinking liquid, and firewood. In each camp, the elite were supported in the style of Hawaiian high chiefs. The lesser stages consisted of frequent rest stops, perhaps in natural rock shelters, warmed by fires as necessary.

Hawaiians utilized two key campsites on the Ainapo; one at the upper edge of the forest (Camp 2), and one further upslope within a large lava tube (Camp 3) in the barren area. Camp 2, a temporary village of thatched houses built for each royal trip to the top, was in an area of high grass with timber adjacent. Camp 2's altitude was approximately 6,500 feet above sea level, and furnished house timbers, firewood and grass for thatching and ground insulation (under sleeping mats) for the subsequent higher camps. Camp 3, in the large lava tube at about

8. SIGNIFICANCE

it was the shortest access to the top both in time and distance. Pack animals shortened by days the round-trip time over the Ainapo and eliminated the supporting cadre of human porters. It took more than 100 Hawaiians to place Menzies atop Mauna Loa in 1794.

In 1916, the U.S. Army pioneered a new trail to the summit to suit the needs of volcanologists headquartered at Kilauea volcano. In 1916, the summit of Mauna Loa, the Army-built trail, and the summit of Kilauea volcano were incorporated within Hawaii National Park, established by Congress that year. This gave the volcanologists and the public a federally controlled route to Mokuaweoweo. After 1916, for the next half century, there were two trails to the summit, but the Ainapo received diminishing usage and was not maintained. Below the barren lavas, the savannah-forest areas through which the Ainapo passed became ranching country -- private land through which public passage was discouraged. Ainapo trail now lies abandoned, unmaintained, overgrown, blocked by barbed-wire cattle fences, and almost forgotten. The 1915 Army-built trail now handles the rare traffic and is the trail shown on the newer USGS quadrangle maps. The Ainapo trail is now out of business, except for the portion above 11,600, most of it within Hawaii Volcanoes National Park.
